

C

BLOCKED

Integrated-strategy gain over benchmarks, by mode
(car/walk/bike/multimodal)

Missing inputs:

- Combined per-edge table joining exposure + vulnerability + utci_peak_c -- the code that would build it (green_mobility.exposure.combine, per cli.py `intervene` command's own error message) has never been run to completion for any city; the interventions/strategies.py ranking functions exist but have never been fed real data.
- vulnerability_index -- never computed (see Fig. 1 Panel D audit)
- A budget-allocation run (allocate_budget over q=1/5/10/20%) -- never executed
 - A random-strategy multi-realization distribution with registered seeds -- never executed
 - car dose-benefit (never computed, see Fig. 3/4 audits)
